**Knowledge Layer
v1 Scope & Prototype
(DRAFT)**

August 2026

Confidential – For Discussion Purposes Only

The Knowledge Layer Initiative – V1 Scope (DRAFT)

WHAT WE ARE BUILDING

Vector's courses are finished, linear titles. The objectives, examples and assessments inside them are welded into that sequence and cannot be reached on their own.

The Knowledge Layer breaks that open. Each course is decomposed into the behaviors it exists to produce, and each behavior becomes a module - its Know, Feel and Do objectives, plus the metadata that lets them be recombined safely.

Held that way, a course can shorten for a learner who already knows the material, adapt to a role, stand alone as microlearning, or arrive as video, audio or article.

WHAT THIS DOCUMENT IS FOR

This is a draft scope for V1, the first release, targeted for mid-2027 - and for the Q4 prototype that tests the approach before we commit to building it.

It is written for four groups at once. The executive team needs scope, cost and the commercial case. Software development needs a specification precise enough to size. The K&A content team needs to know what review load this creates. LMS and Studio product owners need to see where it touches their surfaces.

Read it as a draft. Nothing here is a decision yet.

Key takeaway: A draft for review - eight questions are still open, each with an owner named.

Knowledge Layer V1 Scope & Prototype

WHAT WE COVER

01

The Concept

Why the unit we build is behavioral outcomes, not a course

02

V1 Feature Scope

What is in, what is narrowed, what is deferred

03

Development Scope

Pipeline, metadata, Studio and the LMS platforms

04

Bundles and Courses

Which titles carry V1, and the commercial cut

05

The Prototype

What we build in Q4, and how we judge it

ADDITIONAL TOPICS

■

06 Feasibility - capacity, variants and the manual workflow

■

07 After V1 - how the commercial story compounds

■

08 Open questions still to close, with owners

■

09 Decisions, owners and dates

■

A1 Engagement timeline and Know-Feel-Do metadata detail

■

A2 What is already built, resourcing, constraints and risks

■

A3 Reference material from the August 13 session

Key takeaway: This is a scope document, not a pitch. Section 8 lists what it cannot answer yet.

LearnSimple

Knowledge Layer Goals & Timeline

August 2026

Confidential – For Discussion Purposes Only

Defining V1 Scope - Goals

Insights from Discovery Sessions & Data Review to date

WHAT WE LEARNED	WHAT THAT MEANS FOR V1
Define good before we build	If we can't show it working, it isn't in V1.
Validate with customers early	Buyers cannot fund what they cannot picture. Prototype early.
Keep personalization manageable	Role-based skinning only. Deep personalization stays out.
Lock metadata before extraction	Tagging list must be final before we migrate.
Protect customization	A customer must-have. Learning Studio UX still needs validating.
Translations multiply everything	Course titles in multiple languages (Commercial) potentially 40x.
People are the constraint	Choose features and bundles that consider review time and capacity constraints.
Win V1 first, then go deeper	Replace, do not add. Every extra bundle is another chance to miss.

Knowledge Layer Initiative – Next 12 months

Four phases from POC close to general availability.

Key takeaway: The prototype, not the POC, is the milestone that de-risks the following nine months.

LearnSimple

Knowledge Layer Behavior Learning Objects Architecture

August 2026

Confidential – For Discussion Purposes Only

The Unit We Build Is a Behavior, Not a Course

Decompose a course into the behaviors it exists to produce, then rebuild around them.

A COURSE TODAY

- 01 Shaped around a subject, not an outcome**
Linear, fixed length, one completion record
- 02 Learning objects are welded into the course**
Nothing can be safely reused, recut or resold
- 03 Harassment Prevention (JCOM-40198): 62 screens**
25 objectives - 23 Know, 2 Feel, 0 Do
- 04 Quality is re-verified on every new version**
Cost scales with every variant produced
- 05 Sold as a bundle, priced against generated content**
Anyone can generate a course

A MODULE IN THE KNOWLEDGE LAYER

- One behavioral outcome, stated as something a person does.
- Its Know, Feel and Do objectives scaffolded beneath it.
- A metadata envelope on each objective for safe derivation.
- The unit we build, verify, price and recompose.
- JCOM-40198 gap-filled: 52 objectives, four outcomes, four modules.
- Each module compresses, combines, transforms - or stands alone.

Every Module Has the Same Four Stages

Four stages, in the same order, in every module the Knowledge Layer builds.

Key takeaway: Compression, not exemption - the simulation is the minimum experience.

Four Things Every Module Must Do at Once

Any module we build has to hold up in all four dimensions at the same time.

Key takeaway: They multiply, so a structure has to be judged across the whole variant space, not at one point in it.

Not Every Format Can Carry Every Capability

A mid-module check can re-teach on a miss or push harder on a pass. Only some formats can act on it.

Key takeaway: Score every format and compression pairing before we build it.

LearnSimple

Knowledge Layer V1 Features

August 2026

Confidential – For Discussion Purposes Only

v1 Initiatives — What's In, What's Deferred

15 initiatives, four categories: 9 build in v1, 3 arrive without new build, 3 deferred.

IN V1

- new build in v1
- in v1, but no separate build required

01 ADAPTIVE LEARNING

- **Test Out**
Mastery proven upfront.
- **Test Up**
Need to have more advanced iterations of content when testing up
- **In-Course Remediation**
Reinforcement in the moment.

02 CONTEXTUALIZATION

- **Role-Based Content**
Content adjusts by role (limited roles to manage scalability)
- **Visual Differentiation**
Folded into Role-Based.

03 COURSE ASSEMBLY

- **Microlearning**
Short bursts and micro-courses.
- **Mixed Modalities**
Emerges from modality work.

04 MODALITY TRANSFORMATION

- **Text / Article**
Readable, scannable articles.
- **Podcast / Audio**
Audio-native lessons.
- **Conversational AI Tutor**
Beta in v1.
- **Translations**
Spanish first, top objectives.
- **Video**
Anchor to reuse: AI when possible.

DEFERRED — NOT IN v1

Deep Learner Personalization (02)

Scope and unit-economics risk.

Composite Course Building (03)

Needs stable metadata first.

Short-Form Reels (04)

Reinforcement, not a differentiator.

Customer-Built Authoring

Explicitly out of scope for v1.

What Each v1 Feature Means in Practice

The nine initiatives we are building in v1, and the scope each one carries at launch.

01 ADAPTIVE LEARNING

Test Out

A pretest at module entry. Proven mastery skips the matching objectives, and the completion record still shows full coverage.

01 ADAPTIVE LEARNING

Test Up

Narrow in v1: one advanced path per objective. Learners who prove mastery go deeper instead of treading water.

01 ADAPTIVE LEARNING

In-Course Remediation

A missed check serves reinforcing content in the moment, inside the module, before the learner moves on.

02 CONTEXTUALIZATION

Role-Based Content

Substantive content shifts by role, not just visuals - employee vs. manager, officer vs. industrial worker.

03 COURSE ASSEMBLY

Microlearning

Objectives stand alone as 5-8 minute units, extracted as a module from a course (module = behavioral outcome)

04 MODALITY

Text / Article

The approved script restructured as a scannable article. Fast to reference and accessible by default.

04 MODALITY

Podcast / Audio

Audio-native lessons generated from the same source content, for learners whose hands or eyes are busy.

04 MODALITY

Conversational AI Tutor

Beta in v1. Asks questions, responds to learner input, adjusts on the fly - aimed at Feel and Do objectives.

04 MODALITY

Translations

Spanish first. Any modality, with the SME signature carried into the variant.

ALSO IN V1, WITHOUT NEW BUILD

Visual Differentiation - delivered through Role-Based Content. Mixed Modalities - emerges from the modality set above. Video - existing assets reused wherever possible.

How the Build Works

Content is verified once; every variant is a derivative of that signed baseline.

Everything between the two signatures is derivation: compression, context lens, combination and modality.

Key takeaway: The asymmetry is the point - facts are checked once, so experience review scales.

What Development Has to Build for V1

Eight components, designed backwards from the module rather than the current tool.

WHAT WE BUILD	WHAT IT HAS TO DO	WHY IT MATTERS
Knowledge Layer store	Objectives and outcomes stored as records with IDs, not tags on content	Variants can be computed, not hand-built
Decomposition agents	Extract behavioral outcomes and facts, classify to Know-Feel-Do, propose gap-fill, flag locks	First-pass acceptance is the scale metric
Learning Layer	Propose module structures and score them against all four capabilities	The LED picks from options already proven to hold up
Permutation generator	Render video, audio, article and tutor variants from the signed spec	Cost per course is API spend plus LED review
Delivery player	Every format runs the same checks and the same simulation	A podcast still has to produce a mastery record
Break points	Hand off to the LMS where live branching is not possible	Keeps test-out working in formats that cannot adjust live
Studio review views	SME gate at the spec, LED gate at the experience, with routing	Agents produce; people review and approve
LMS plumbing	Pass sector and subsector to the player; assign and report variants	SafeLMS handles variants today; others do not

Key takeaway: The Knowledge Layer stores objectives as data. Everything downstream is computed from it.

The Metadata We Have to Lock Before Extraction

Six layers. Anything not captured before extraction runs is lost or expensive to rebuild.

LAYER	FIELDS TO LOCK	WHY IT MATTERS
Instructional	Outcome ID, objective text, KFD domain, must-pass flag	Test-out and remediation depend on these
Classification	KFD sub-level (1 of 14), construct, context sensitivity	Keeps AI and LED classification aligned
Provenance	Source course ID, screen reference, last update, SME of record	Keeps the content defensible years later
Compliance	Regulation, accrediting body, jurisdiction, expiry, lock level	Locked items are served harder, never cut
Delivery	Sector, subsector, role, environment, modality, language	Drives assembly; wrong here, personalization breaks
Commercial	Course level, SKU, bundle, usage, edit permissions	Sets what a tenant may see and may edit

Key takeaway: Locked recommendation is due end of August - extraction cannot start before it.

The Knowledge Layer Inside Learning Studio

One authoring environment: sources in, reviewed learning objects out, assembled into a course.

Underneath it all: instructional metadata — objectives, modality rules, audience rules, regulation and review history

Key takeaway: This is not a new tool. It is Learning Studio with the composition work done for you.

The Workflow, Rebuilt Inside Learning Studio

Studio is where the courses live. It also has to be where clients configure them.

WHAT THE WORKFLOW NEEDS

01

A Review Queue, Not a Canvas

The LED opens Studio and sees only what awaits approval.

02

SME Gate at the Spec

Accept, reject or replace each gap-filled objective.

03

LED Gate per Permutation

Approve or reject with a reason; rejection requeues that item.

04

Locks Enforced at Generation

Regulated text and narrative anchors flagged in metadata.

05

First-Pass Acceptance Tracked

Acceptance rate and review hours, logged per objective.

WHAT CLIENTS CONFIGURE

- Suppress or add content at the object level
- Choose which modalities a learner may switch to
- Select the variants their population needs
- Edit translations without breaking the approved spec
- Cut a course down to a defined micro-learning slice
- Guardrails so customization cannot break compliance
- Studio, or the LMS configuration they use today

Key takeaway: Studio needs a review-and-approve queue, not another authoring canvas.

The Workflow Inside Learning Studio

One environment: agents produce, two human gates approve, and the tenant configures what ships.

Key takeaway: Two human gates, and only two - the spec, and the finished build.

Learning Studio: The Administrator View

All five are mocked in the Q4 prototype. These are the recommendations for what V1 actually builds.

WHAT AN ADMIN MUST BE ABLE TO DO

01

Find and Assign

Discoverable and assignable like any other course title.

02

Configure Variants

Choose which role and sector variants a tenant can see.

03

Set Modality Rules

Allow or restrict read, watch and listen per client policy.

04

Report and Audit

Completion, seat time and evidence an accreditor accepts.

05

Control Test-Out

Decide whether learners can test out, and at what mark.

REAL IN V1, OR DEFERRED

- 01 Real - nothing sells if an admin cannot assign it
- 02 Real in EDU via SafeLMS;
- 03 Real, but tenant-level on and off, not per course
- 04 Real minimum: one completion record per course
- 05 Real - it is the compliance safety valve
- Deferred to V2: variant-level analytics, multi-state rules
- The prototype fakes all five - we want reaction, not function

Key takeaway: If an administrator cannot configure it, a composed course cannot be sold.

Assignment Across Vector's LMS Platforms

A composed course only sells if an administrator can assign and report on it.

THE ASSIGNMENT PICTURE

01

SafeLMS Handles Variants

Admins tick variants; jurisdiction resolves itself.

02

Commercial LMS Does Not

No native variant logic, so assignment needs a path.

03

Multi-State Employers

One population, several jurisdictions to satisfy.

04

One Assignment, Many Modes

Admins should not assign four versions of a course.

05

Reporting Expectations

EDU power users want impact data, not completions. Need to address gap in COM and PS reporting

WHAT WE MOCK UP FOR THE PROTOTYPE

- Find and assign a composed course
- Configure variants and modality rules
- Set what a learner may test out of or skip
- Report at object level, not just completion
- The same flow shown on each LMS surface
- Validated with admins before anything is built
- LMS product owners brought in at scope lock

Key takeaway: SafeLMS already solves variant assignment. The other platforms do not, and that gap is an adoption risk.

LearnSimple

Knowledge Layer V1 Course Bundles

August 2026

Confidential – For Discussion Purposes Only

Two Candidate Course Bundles, Still Being Vetted

Chosen to balance risk and learning. The commercial cut lands this week.

THE TWO BUNDLES

Proving out recomposition with two content bundles

Each bundle can be a single composite assignment or separate assigned trainings, each assembled from shared, human-reviewed learning objects — chosen to prove the recomposition factory at opposite ends of the risk spectrum.

BUNDLE A Higher Ed Safety & Well-Being	BUNDLE B Durable Skills for Frontline Leaders
For incoming first-year students – hallmark use case AlcoholEdu for College CannabisEdu Rx Drug Misuse Prevention Hazing Awareness & Prevention RespectEdu for Undergraduates Mental Well-Being for Students Building a Welcoming Community Tier 1 · specialist review · 3M+ HE-student completions	Commercial + public sector — proven demand in both Communication Skills for Supervisors* Conflict Management Managing Stress at Work Critical Thinking & Problem Solving Smart Time Management* Developing Your Leadership Style Tier 2/3 · inexpensive review · 29k annual completions (16k COMM + 13k PS)

*also in EDU catalogue

**Two bundles at opposite ends of the risk spectrum —
chosen so v1 proves the recomposition factory holds at both extremes of cost and scrutiny.**

Knowledge Layer v1 · 8

THE COMMERCIAL VETTING

Why these two course bundles

Bundle A: market demand, simplifies personalization, high-stakes, regulated, high scrutiny.

Bundle B: lower-stakes, complementary titles chosen to show features and test personalization.

The trade-off

High usage proves demand but invites harder critics.
Low usage lowers risk and allows for testing additional permutations.

This week

Investigating course usage, revenue and complimentary bundles. A stronger bundle than B may exist.

Key takeaway: A reasoned lean, not a locked decision - the demand data lands this week.

Bundle Alternatives on the Table

Bundle A holds. Bundle B is the one under commercial pressure.

THE OPTIONS

- 01 Keep Bundle B As Proposed**
Complementary PD titles, low stakes, easy to vary.
- 02 Swap In Higher-Value Titles**
Anti-Harassment brings ACV that PD titles lack.
- 03 A Feature-Led Bundle C**
Titles chosen to exercise six of the seven features.
- 04 Named Candidates So Far**
Hazing or mental well-being, not the branching titles.
- 05 What K&A Would Change**
The library view we do not have from the outside.

WHAT EACH BUNDLE HAS TO PROVE

- Bundle A: high-stakes content against one simple role
- Bundle B: role-based personalization at lower risk
- Either: micro-learning that still makes sense alone
- Either: modality switching without losing rigor
- Level 1-2 media, not the hardest builds in the library
- A pack that can be priced, not given away as fries
- Cohesion is worth less than a customer already paying

Key takeaway: Keep the categories the bundles represent, even if the titles inside them change.

Bundle C: The Commercial Heavy Hitters

The proposed replacement for Bundle B - HSE compliance titles, where commercial demand sits.

CANDIDATE TITLE	WHY IT QUALIFIES	WHAT IT LETS US TEST
Bloodborne Pathogens	Highest utilization in the catalog, by a wide margin	Cross-sector context: K-12, law enforcement, welding
Hazard Communication	Core OSHA requirement; a scenario already exists	Reuses built assets, so less new media
Fall Protection	OSHA top-ten hazard with high commercial usage	Role and environment lenses at low media cost
Confined Space Entry	Procedure-heavy, so genuine Do content exists	Scenario Simulator as the culminating demonstration
Ladder Safety	Perennial OSHA top-ten list item	Microlearning: a fifteen-minute standalone module
Personal Protective Equipment	Broad applicability across every subsector	Contextualization across all four subsectors
Electrical Safety	Regulated, high scrutiny, supervisor cut exists	Employee versus supervisor role permutation
Lockout / Tagout	High usage, but already built as a gamified course	Hold back - the existing build competes with the test

Key takeaway: Twelve HSE titles carry roughly 20% of annual usage. Bundle B carries almost none of it.

LearnSimple

Knowledge Layer V1 Prototype

August 2026

Confidential – For Discussion Purposes Only

Prototype: Selecting the Courses from the Proposed Bundles

One to two courses per bundle, chosen to be representative rather than difficult.

SELECTION CRITERIA

01

Representative, Not Hardest

Mid-complexity titles that still exercise Know-Feel-Do.

02

One Per Level Band

One level 1-2 course and one level 3-4 course in the pair.

03

Media Worth Reusing

Level 3-4 media that should survive recomposition intact.

04

Clean Provenance

Recently updated, named SME, no accreditation change due.

05

Commercially Legible

A course a customer recognizes and a seller can price.

QUESTIONS FOR THIS SESSION

- Which two courses from Bundle A, and which from Bundle B?
- Do we need a course from each level band, or is one enough?
- Who signs off the shortlist, and by what date?
- Does a course in flight for re-accreditation disqualify itself?
- What is the fallback if the demand data moves the bundles?
- How much existing media do we intend to reuse untouched?

Key takeaway: Pick the courses that teach us the most per hour of build, not the ones that impress the most.

Building Prototype in Q4 '26 to validate v1 approach

A prototype validated commercially and internally is the strongest path to a confident V1 delivery. Late September-December 2027.

WHAT WE BUILD

- 01 One course recomposed from each bundle**
One level 1–2 build, one level 3–4 build
- 02 Leveraging what is already built for prototyping**
The existing preview shell becomes the prototype
- 03 Learning Experiences have a narrative thread**
Character-driven bookends tying the objects together
- 04 Personalization made visible**
Two audience variants of the same objectives
- 05 Modality switching on demand**
Read, watch or listen within one experience
- 06 Adaptive learning in the flow**
Test out, test up and in-course remediation

WHAT IT MUST PROVE

- Better than the original course, judged side by side on the same content
- High-value level 3–4 media survives intact where it should
- AI gap-fill output is accepted by an LED without a full rewrite
- A learning object still makes sense pulled out on its own
- LED hours per course are equal or lower than a conventional rebuild
- Customers say the experience is worth paying more for

Key takeaway: We are no longer testing whether it works. We are testing whether it is better (internally & commercially).

Defining the Prototype We Build Toward

We agreed we need to know what good looks like before we build it.

WHAT THE PROTOTYPE MUST DO

- 01 One Composite Outcome**
A single topic, decomposed and reassembled end to end.
- 02 Two Defined Roles**
Two sectors, two roles. Not every permutation.
- 03 Two or Three Modalities**
Enough to show choice without full production.
- 04 Test Out / Test Up - Continuity Under Removal**
Still reads when a piece is taken out.
- 05 Scoreable**
A rubric we and customers can rate it against.

QUESTIONS TO ANSWER

- How small can this be and still tell us whether it works?
- Should AI build a whole outcome at once, not object by object?
- Who writes the scorecard, and what does it measure?
- Can we test this outside the LMS, or does it need to be built in?
- How long will it take, and what gets dropped to make room?
- Do we pick an easy course for this, or a hard one?

What Great Looks Like, and What We Count

QUALITATIVE — THE COURSE EXPERIENCE

- 01 Better Than the Original**
Same content, same rubric, measured side by side.
- 02 Engagement, Not Completion**
Choice and modality should lift time on task.
- 03 Pedagogical Rigor Holds**
Every video, podcast and article teaches what the SME approved.
- 04 Narrative Thread Intact**
Or evidence it was never what carried the course.
- 05 The Learner Would Choose It**
Preference tested against the course they take today.

QUANTITATIVE — SCOPE AND EFFORT

- First-pass acceptance rate at the learning-object level
- SME hours per course, and where in the flow they land
- LED hours per permutation actually reviewed
- Production effort per modality generated
- The full path works: authoring, assigning, reporting
- Commercial signal: would a buyer pay more for this
- Stop condition: the result that makes us stop

Key takeaway: Agree the scorecard before October, or the Q4 window produces opinions instead of evidence.

How We Measure the Prototype

One course per bundle, selected sections only, graded feature by feature.

WHAT WE MEASURE, AND HOW

01 Learner Outcome

Qualitative: scored against the original, same rubric.

02 Content Quality

Quantitative: first-pass acceptance at object level.

03 Production Effort

Quantitative: SME and LED hours per object vs. rebuild.

04 Commercial Signal

Qualitative: customers say it is worth paying more for.

05 Operability

Quantitative: workflow run manually before we build it.

OPEN DECISIONS BEFORE OCTOBER

- What is the pass mark, and what result would make us stop?
- Do we benchmark against the original course or a rebuild?
- Which customers see it, when in Q4, and who runs it?
- Do we capture real usage data, or judge the output by expert review?
- What baseline hours must we capture before October?
- What are we deliberately not measuring in the prototype?

Key takeaway: We measure features, not courses — the prototype has to prove the engine before we build it.

What Each Prototype Course Proves

Every V1 capability mapped to the course that exercises it, and to what depth.

V1 CAPABILITY Tested in the Q4 prototype	BUNDLE A COURSE Higher-ed - L3/L4 - one role	BUNDLE C COURSE HSE - L1/L2 - many roles	WHAT THE PROTOTYPE HAS TO SHOW
Test Out / Test Up	FULL	PARTIAL	Pre-test compression holds without breaking the completion record.
In-Course Remediation	FULL	PARTIAL	A miss re-teaches inside the module, not after it.
Role-Based Content	NOT TESTED	FULL	One verified objective, rendered for two different roles.
Microlearning	PARTIAL	FULL	A single behavior stands alone as a 5-8 minute unit.
Modality Switch (text - audio)	FULL	PARTIAL	Learner changes format mid-module and keeps credit.
Translation (Spanish, top LOs)	PARTIAL	FULL	A variant inherits the SME signature without re-review.

FULL = exercised end to end · PARTIAL = one selected section only · NOT TESTED = covered by the other bundle

Key takeaway: Course selection is a coverage decision - every V1 capability has to be proven in full by at least one course.

LearnSimple

Knowledge Layer V1 Workflow & Capacity Planning

August 2026

Confidential – For Discussion Purposes Only

Build vs Migration / SME Time

Three Pathways for Course Authoring. SME time is concentrated where it is expensive and high-value, not spread evenly.

**Key takeaway: SME time concentrates at extraction and sign-off, not on every derivative.
Full review on the first wave; over time a panel validates the process rather than every course.**

Migrate, Build, or Hybrid: The Prototype Decides

We will not force a KPI before the prototype gives us real numbers.

Key takeaway: The prototype sets the migrate-vs-build threshold, not a KPI we guess at today.

The Capacity Envelope

K&A capacity is a points budget, not a headcount. Two bundles have to fit inside it.

WHAT THE MODEL SAYS

- 01 7,512 Points Per Quarter**
Conservative capacity across the three segments.
- 02 15 LED FTE**
Public sector 6, education 4, commercial 5.
- 03 COM 2,840 / EDU 2,156 / PS 2,516**
The segment splits that bundle choice draws against.
- 04 Only 5,072 Points Move**
2,440 are hard-capped to dedicated teams.
- 05 Rate x Minutes x % Update**
The formula every bundle estimate has to survive.

WHAT THE MODEL DOES NOT TELL US

- SME hours per course, at extraction and at sign-off
- LED hours per permutation reviewed
- QA and delivery load per composed course
- Current BAU commitments through Q4
- Review cycles before a first pass is accepted
- Whether hourly SMEs stay willing at fewer hours
- These are the numbers we need from this room

Key takeaway: Two thirds of quarterly capacity can move. The rest is locked to dedicated teams.

Variants Are Where Feasibility Breaks

Every variant multiplies media, and media is where the points and the calendar go.

THE MULTIPLIERS

01

Role and Sector Variants

Law, fire, industrial, education, plus supervisor cuts.

02

Jurisdiction Variants

Simple for one district, hard for multi-state employers.

03

Modality Permutations

Video, audio, text and tutor for every learning object.

04

Translation Depth

Captions and narration today. On-screen video is new.

05

Client Customization

Customer edits create assets nobody at Vector QAs.

PIPELINE PRESSURE POINTS

- Simulation: 150 points a quarter, all segments
- AI media: 150 points a quarter
- Cinematic: 700 points, education and public sector only
- 3D animation: 1,440 points, commercial only
- Presenter and animation: zero commercial capacity
- Media level sets the pathway rate, so favour level 1-2
- Child Abuse Reporting already carries 30 variants

Key takeaway: The variant and translation policy sets the cost of v1 more than the feature list does.

Prototype - Run the Workflow Manually First

Every step we run by hand in Q4 is a step we can specify precisely, and cost, before we build it in 2027.

SIMULATE NOW, BUILD LATER

01**Review Queue on Paper**

Run human-in-the-loop as a tracked sheet, not a built queue.

02**Metadata Tagged by Hand**

Tag the selected courses manually against the field spec.

03**Human Routing**

A person moves work between steps, and we time every handoff.

04**Assembly in the Existing Shell**

Reuse the preview shell rather than build new authoring UI.

05**Instrument the People**

Log hours, rework and rejection reasons at every gate.

QUESTIONS FOR THIS SESSION

- Which steps get built, and which stay manual?
- Who runs the manual queue, and for how many hours a week?
- What must we log to size the V1 build credibly?
- How many courses can we push through by hand?
- Does manual tagging give a real estimate for automation?
- What might we learn wrong by faking a step?
- When do we stop simulating and start building?

Key takeaway: The prototype's job is to produce the specification for the workflow, not the workflow itself.

LearnSimple

Knowledge Layer Open Questions

August 2026

Confidential – For Discussion Purposes Only

OPEN QUESTIONS - To Close Before Scope Lock

Eight questions this draft cannot answer. Each changes the build, cost or story.

THE QUESTION	WHY IT IS OPEN	WHO CLOSES IT
Does Bundle C replace Bundle B?	No commercial support for PD titles; Bloodborne Pathogens is the stronger test	Rob Buelow with the GMs
*How deep do translations go?	Captions and narration today; recomposing video per language explodes the asset count	Rob S with Chuck
*SME review on every derivative?	Position is no after v1, but the hypothesis has to be proven at v1 first	Michael and Rob Buelow
*Clean modalities, or wrapped?	A wrapped podcast loses its appeal; a clean one carries no mastery record	Product decision or admin setting
*Do break points ship in v1?	They stop non-branching modalities degrading test-out. High leverage, small feature	Chuck and Dustyn
*How do admins edit and assign?	Studio customization is live in EDU only; commercial LMSs land through 2027	Sarah Peltier and Dustyn
Sector defaults for test-out?	EDU, public and commercial will not want the same dials	Michael with the GMs

Key takeaway: These are decisions, not analysis. Every one of them needs an owner and a date in the next two weeks.

Decisions, Owners and Dates

Five decisions turn this session into a draft V1 scope next week.

THE DECISIONS

01**Shortlist the Courses**

One or two per bundle. Rob Buelow, Michael and Jessica.

02**Confirm or Replace Bundle B**

Commercial cut against the data. Rob Buelow.

03**Sign Off What Great Means**

The prototype scorecard. Michael and Rob Buelow.

04**Set Variant and Language Depth**

Scope for prototype and V1. Product.

05**Name the Capacity Ask**

Points and people by segment. Michael and Lexi.

STILL OPEN AFTER TODAY

- Whether derivatives need SME sampling at V1
- Whether an accrediting body can bless the process
- How SMEs are paid as their hours fall
- Which LMS changes carry sector context through
- When UX joins the admin and workflow design
- Whether composite assembly stays out of V1
- How soon the customer advisory council starts

Key takeaway: The draft scope depends on these five decisions, not on further analysis.

LearnSimple

Knowledge Layer V1 Appendix

August 2026

Confidential – For Discussion Purposes Only

Appendix

Reference material from the August 13 stakeholder session, kept for context.

WHAT FOLLOWS

01**Engagement Timeline Detail**

Weeks three to six, and the run to scope lock.

02**Metadata and Know-Feel-Do**

The spec the SME gate approves against.

03**What Is Already Built**

Extraction, generation and the preview player.

04**Resourcing and Constraints**

The budget recast and the gaps it names.

05**Scenario Simulator Overlap**

Where the two initiatives meet after October.

ALSO IN THE APPENDIX

- Build versus migrate, and where SME time lands
- Delivery risks named at the stakeholder session
- How the V1 wow factor compounds afterwards
- Where V1 sets the table for V2 and V3
- Week three areas where we go deeper
- Earlier versions of the bundle and SME slides
- Original stakeholder deck ordering, unchanged

Key takeaway: Nothing here is new. It is the backup for questions the main agenda will raise.

VECTOR SOLUTIONS · KNOWLEDGE LAYER · WORKING CONCEPT

The unit of our product is a **behavior**, not a course.

A Know·Feel·Do concept for what an ideal recomposed course looks like — and what the Knowledge Layer has to deliver to make it real.

Generation is not the differentiator.

If our story is "we use AI to adjust content," we are selling a commodity and competing on price with tools our customers already have.

THE COMMODITY

Anyone can generate a course. Any content vendor, any general-purpose model, any customer with a subscription. Pricing generated content against generated content is a race we do not want to run.

WHAT WE SELL INSTEAD

A validated behavioral substrate and the development process built on it. The output is not "content about safety" — it is a set of behaviors a workforce can be shown to perform.

WHY KNOW · FEEL · DO IS THE MOAT

KFD is a chain of conditions, not a taxonomy. A course covering only Know is not a shorter route to behavior change — it is a different product that does not produce it.

"Sure, you can use generic AI tools or a non-specialized content vendor. We can do everything they can — and produce the behavior change you actually care about, because of our learning science framework and development process."

A behavioral outcome becomes a module.

Decompose the course into the behaviors it exists to produce. Populate each behavior across Know, Feel and Do. That package — outcome plus its objectives plus their metadata — is the module, and the module is the unit we build, verify, price and recompose.

Every learner experience we ever ship is derived from this. Nothing a learner sees is authored outside it.

Per the Denver offsite, the behavioral outcome is also the most granular cut we support in a customer-facing menu — we do not sell or recombine individual objectives.

Two signatures, in two different places.

Quality has to be inherited across permutations rather than re-verified at each one — otherwise this does not scale past a handful of courses.

What the SME signs — once

The Know-Feel-Do mapping of learning objectives to behavioral outcomes, and the metadata on each objective. This is the foundational material every variant is derived from.

What the LED signs — per engagement

The recomposed experience: which proposed structure, which lenses, which modalities. Quality is retained because every permutation is a derivative of a signed baseline.

Everything between the two signatures is derivation — adaptation, contextualization, assembly, transformation

Our courses are almost entirely Know.

Harassment Prevention for Employees (JCOM-40198) — 62 screens, five case narratives, a running storyline. Every learning objective extractable from the script, classified:

TODAY

Know 23 · Feel 2 · Do 0 25 objectives

0

objectives in the course today that ask the learner to perform the behavior

RECOMPOSED

Know 23 · Feel 17 · Do 12 52 objectives

+27

objectives added by SME gap-fill — the motivational conditions and the performance tasks

0

objectives removed. The recomposed course is a superset, not a substitute

The course ends on the five Ds of bystander intervention — and contains no objective written as a behavior, and no moment where the learner performs one. Completion evidences exposure. That is all it can evidence.

Every module has the same shape.

Whatever structure the Learning Layer proposes, this is the skeleton underneath it — which is what lets modules be compressed, contextualized, combined and transformed without losing cohesion.

ENTRY**Pre-experience battery**

Load-bearing Know and Feel items only. Powers test-out, test-up and remediation. No Do items — a question cannot credibly measure behavior.

LEARN**Instructional beats**

One per objective not already proven. Compliance-locked objectives are never removed — they are served harder.

CHECK**In-module mastery checks**

Gating items the learner has not yet proven. Non-gating items sampled across the cohort, not asked of everyone.

PERFORM**Culminating Scenario Simulator**

Always present. Demonstrates the module's behavior against a SME-validated rubric — and doubles as verification for a learner who tested out of everything.

Compression, not exemption.

A learner can test out of every instructional objective and still enter the module — the simulation is the floor, and any gap it exposes is repaired inside it as feedback. Administrators decide whether test-out is available at all, and can flag content as required so it is tailored rather than removed. Seat time is preserved; the time is just better spent.

Four capabilities, one module.

These are not four features — they multiply. A module exists in a compression state, in a context lens, in a combination and in a modality all at once. A structure that is elegant at full length and collapses when three objectives drop out is not a structure we can sell.

1

Adaptation

Flow and cohesion hold when a learner tests out of objectives, or when objectives get harder or easier.

Example: a learner proves 3 of 13 objectives; the module compresses around them without losing its through-line.

2

Contextualization

Same instructional focus and rigor, applied to different learner types.

Example: the same intervention module set on an assembly line, in a staff meeting, and at a shift briefing.

3

Assembly

Blends with modules from the same or different courses, or stands alone as microlearning.

Example: pair "Step In" with modules from Bullying and Workplace Violence to build a Speak Up series.

4

Transformation

Delivers through multiple modalities without becoming a different experience.

Example: the same module as a video course, a podcast, an article, or an AI tutor.

A structure that is elegant at full length and collapses when three objectives drop out is not a structure we can sell — so the proposals have to be scored across the whole variant space, not at one point in it.

Some modalities degrade some capabilities.

Worth naming rather than discovering during build. A podcast cannot branch mid-stream; an article cannot adapt in real time. Break points are the repair — the article that stops to ask a pathing question, the chapter boundary that hands off to the LMS.

MODALITY	BRANCHING	BREAK POINTS	SIMULATION	NOTE
Video course	Native	Native	In-experience	The reference rendering — the point in the variant space the SME signed.
AI tutor	Native	Continuous	Native	Most adaptive. Compression is native: the tutor simply does not raise what is proven.
Article	Pre-rendered	Inline pathing question	After, in the LMS	Break points restore routing without live branching.
Podcast	Pre-rendered	Chapter boundary only	After, in the LMS	Weakest fit. At high compression the cut gets so short the learner asks why they listened.

Open position: alternative modalities can be clean standalone experiences (engaging, no record, no attestation) or fully wrapped in the mastery machinery (record-bearing, less appealing). Most likely an administrator setting rather than a product decision — but it changes what the modality is for.

Provenance is the start. Evidence is the destination.

We will not have outcome data on day one, and the story cannot depend on it. It can be built so the data accrues automatically — and so the system improves itself from what it collects.

AT LAUNCH

Provenance

Every objective a learner meets traces to a SME-signed KFD mapping with its theoretical construct attached. The claim is about process — and it is verifiable end to end.

“Every minute of this is here because a named condition of behavior change requires it.”

ACCRUING

Performance

Each module closes on a simulation producing a rubric-scored performance record rather than a completion tick. Objective-level data accumulates across the cohort.

“We can tell you which behaviors your workforce can actually perform, by objective.”

COMPOUNDING

Evidence

With enough records the derivation rules become testable. Permutations that underperform on the same rubric get down-ranked and reworked; those that work get promoted.

“The system gets better at recomposition because it watches what recomposition produces.”

The measurement loop is not a separate chapter — it is what turns a process claim into a product advantage that compounds.

Four decisions this model forces.

Each is a genuine fork. The concept holds either way — but the product, the roadmap and the sales story differ materially depending on the answer.

D1 Are alternative modalities clean, or fully wrapped?

A wrapped podcast is no longer what made podcasts appealing. A clean one cannot produce a mastery record or satisfy an attestation. Customer setting, product decision, or permanent position?

D2 Do break points ship in v1?

They are what stop non-branching modalities from degrading mastery-based sequencing. Possibly the highest-leverage small feature in the model — or a fast-follow.

D3 What are the sector defaults for test-out?

Education, Public and Commercial will not want the same dials. Compliance-locked objectives must test up rather than disappear. One library, different settings.

D4 Can the pre-experience ever exempt a whole module?

Our position is no — the simulation is always the floor. Defensible, but it caps how short a compressed experience gets and makes simulation throughput a scaling constraint.

And the question underneath all four: is the metadata envelope rich enough that derivation between the SME signature and the learner is genuinely safe?

APPENDIX

The worked example

Harassment Prevention for Employees (JCOM-40198), decomposed into four behavioral outcome modules — with two rendered permutations, the structures the Learning Layer would propose, and the metadata that makes derivation safe.

The course we started from.

JCOM-40198 Harassment Prevention for Employees (US Base) — a well-made, conventional compliance course. Nothing here is a criticism of the content; it was built to a different standard of evidence.

screens

4

linear sections

5

case narratives

~50

minutes

01	Introduction	Two-presenter framing; an opening scene the learner is later asked to re-read.
02	What constitutes harassment	Federal statutes; quid pro quo vs. hostile work environment; bullying; the Mila, Marshall, Ira and Oslo cases.
03	Responding to harassment	The Della / Bill / Steph storyline; reporting channels; the bystander effect and the five Ds.
04	Retaliation	Definitions and forms; who can be retaliated against; supervisor duty; the Steph and Marvin case.

Source: JCOM-40198 course script, 62 slides.

Four behavioral outcomes, four modules.

The outcomes are stated as things a person does, in the first person. Counts show the KFD composition after gap-fill, and how much of it the base course already contained.

BO-1

Name It

When I encounter conduct that may be harassing, discriminatory or bullying, I judge it correctly against the standard — and treat it as reportable rather than rationalizing it away.

K 9

F 4

D 2

10 from base course

+5 SME gap-fill

BO-2

Step In

When I witness harassment or bullying, I take an action suited to the moment rather than waiting for someone else to act.

K 5

F 5

D 4

5 from base course

+9 SME gap-fill

BO-3

Report It

When I experience or witness harassment, I report it through a channel that triggers action, with the specificity an investigation can act on.

K 4

F 4

D 3

5 from base course

+6 SME gap-fill

BO-4

Protect the Reporter

After a report is made — by me, about me, or near me — I act in ways that protect the person who reported, and I recognize retaliation when it appears.

K 5

F 4

D 3

5 from base course

+7 SME gap-fill

25 objectives in, 52 out. The four modules together cover everything the base course covered, plus the conditions and performance tasks it never had.

Module 2 • Step In — every objective.

The clearest case in the course. Bystander intervention is what the base course builds toward and names in its final section — and it arrives with five Know objectives, no Feel, and no Do.

K1	Know / Remember	Define "bystander" and the Bystander Effect.	from base course
K2	Know / Understand	Explain the common barriers to intervention, including diffusion of responsibility.	from base course
K3	Know / Remember	Recall the five Ds: Direct, Distract, Delegate, Delay, Document.	from base course
K4	Know / Evaluate	Select the tactic best suited to a given situation and constraint.	from base course
K5	Know / Observe	Notice the specific moments in a scene where intervention was still possible.	from base course
F1	Feel / Perceive	Recognize that most colleagues would support an intervention, not resent it.	SME gap-fill
F2	Feel / Value	Expect that intervening changes the outcome for the person targeted.	SME gap-fill
F3	Feel / Align	Connect intervening to the kind of colleague you intend to be.	SME gap-fill
F4	Feel / Can	Believe you can intervene without escalating or damaging your standing.	SME gap-fill
F5	Feel / Believe	Agree that this is your business even when you are not the target.	SME gap-fill
D1	Do / Activate	Recognize and act on the cue to intervene while the moment is still open.	SME gap-fill
D3	Do / Create	Adapt when the first attempt fails, or when the person harassing outranks you.	SME gap-fill
D4	Do / Sustain	Follow up with the person afterwards rather than treating the moment as closed.	SME gap-fill
D2	Do / Apply	Execute a chosen tactic in a live situation and hold it under pushback.	gap-fill · culminating sim

5 objectives from the base course · 9 added by SME gap-fill · the base course contained no Feel or Do objective for this outcome.

One permutation: partial test-out, manufacturing, video.

Module 2 as a learner on second shift would receive it, having proven three objectives in the entry battery. Every beat is computed from objective metadata — none of this is authored per permutation.

SCENARIO PREMISE

The tool crib at shift change. A group's ongoing "joke" about a co-worker has a clear audience and a clear target.

ENTRY	Pre-experience battery — load-bearing Know and Feel items across all four modules	17 items · no Do items asked
VERIFIED	K1, K2, K3 proven — instruction suppressed	3 of 13 objectives · compression, not exemption
LEARN	Remaining Know objectives delivered, contextualized to the line	K4 and K5 tagged high context-sensitivity → visual + flavor variant
LEARN	Five Feel objectives — norms, value, identity, self-efficacy, ownership	all five added by SME gap-fill; none existed in the base course
LEARN	Three Do objectives — activate, adapt, sustain	rehearsal beats, not exposition
CHECK	In-module mastery checks on objectives not yet proven	3 gating items · non-gating items sampled across the cohort
PERFORM	Scenario Simulator — live intervention rehearsal with an AI in-scene character	rubric-scored · SME-validated ideal-response criteria

RECORD: 3 of 13 objectives verified by test-out · 10 instructed · rubric-scored performance record · attestation intact · ~33 min

A second permutation: maximum compression, podcast.

The same module for a learner who proved everything in the entry battery, delivered as audio. This is the hardest cell in the model, and it is worth looking at directly.

What the learner receives

- Entry battery: all 13 instructional objectives proven
- A very short pre-rendered audio cut — there is no live branching to compress against
- One chapter break point handing off to the LMS for a pathing question
- The Scenario Simulator, delivered in the LMS after the audio

~14 minutes, most of it the simulation.

Where it strains

- The audio is now so short the learner reasonably asks why they listened at all
- Break points repair routing, but cannot restore a narrative that was written to be heard whole
- The modality has become a wrapper around a simulation rather than an experience

Argues for suppressing passive modalities at high compression rather than rendering them badly.

The useful conclusion:

capability integrity should be computed per permutation and surfaced to the LED, not assumed. If the Learning Layer can score a permutation against the four capabilities before it is built, it can decline to offer the ones that will disappoint.

What the Learning Layer proposes; what the LED picks.

Not a finished course and not a blank page. Three candidate module structures, each scored on how well it holds under the four capabilities — because a structure that collapses under compression is not one we can sell.

OPTION A

Continuous narrative

One storyline for the length of the module: a single situation from first signal to resolution, with beats attached to points in the story.

Sequencing	■ ■ ■ ■ ■
Contextualization	■ ■ ■ ■ ■
Combination	■ ■ ■ ■ ■
Transformation	■ ■ ■ ■ ■

Strongest engagement, weakest under compression — remove three objectives and the story loses its connective tissue.

OPTION B

Case ladder

Three escalating cases, each self-contained, each raising the judgment required. Objectives map cleanly to cases, so a case can be added, hardened or dropped whole.

Sequencing	■ ■ ■ ■ ■
Contextualization	■ ■ ■ ■ ■
Combination	■ ■ ■ ■ ■
Transformation	■ ■ ■ ■ ■

The workhorse. Compression and combination operate on whole cases, so cohesion is structural rather than editorial. Default for regulated content.

OPTION C

Coach-led rehearsal

An AI coach frames the behavior, the learner practices it immediately, and instruction arrives as debrief between reps rather than up front.

Sequencing	■ ■ ■ ■ ■
Contextualization	■ ■ ■ ■ ■
Combination	■ ■ ■ ■ ■
Transformation	■ ■ ■ ■ ■

Most differentiated, least portable — it barely survives translation to podcast or article. Reserve for high-stakes Do-heavy outcomes.

The metadata that makes derivation safe.

The SME signs the classification and this envelope. Everything downstream — what compresses, what is served harder, what gets a contextual variant, what is asked of whom — is computed from these fields rather than decided case by case.

KFD domain + sub-level	Know / Feel / Do and one of fourteen sub-levels	Determines where the objective sits in the behavior-change chain.
Theoretical construct	e.g. Self-Efficacy (Bandura), Outcome Expectancy, Social Norm Perception	The semantic anchor that keeps classification consistent across LEDs and agents.
Job label	gating · credit-bearing · insight-only	Decides who is asked what. Write a question for every objective; do not ask every question of every learner.
Compliance lock	statutory / required / open	Locked objectives are never removed by compression — they are served at higher difficulty.
Context sensitivity	low · medium · high, derived from cognitive process, skill nature, domain and intent	Decides generic fallback vs. visual variant vs. visual + flavor for a given lens.
Application contexts	the roles, environments and jurisdictions the objective is valid in	Bounds which lenses may claim it, and where a separate objective is required instead.

WHAT WE ARE ASKING FOR

Design the technology backwards from this.

- 01 A Knowledge Layer that stores behavioral outcomes, KFD-classified objectives and the metadata envelope as first-class objects — not as tags on content.
- 02 A Learning Layer that proposes candidate module structures and can score each one against all four capabilities before it is built, so the LED chooses among options that already hold.
- 03 A delivery environment that can wrap any modality in the same assessment and simulation machinery, with break points where live branching is not possible.
- 04 A measurement path that produces objective-level performance data from day one, so provenance can become evidence without re-authoring anything.

Knowledge Layer Initiative - Scope of Work

Review of the four collaborative workstreams during the 6 week engagement. (Currently in Week 3)

01

Build-vs-Migrate & Future Authoring Model

- Help Vector to decide how content is authored going forward (migrate, build new, or hybrid)
- Define Vector's future content authoring model
- Use cost, revenue & adoption data to pinpoint when building beats migrating

Deliverable: Build-vs-Migrate Framework & Future Authoring Model

02

Content Architecture & Content Gap Strategy

- Analyze Vector commercial usage and revenue data
- Help to segment & prioritize the 6,000-course library into personalization tiers
- Help to set Vector reuse-vs-rebuild rules and context guardrails
- Help Vector to define the metadata behind Know-Feel-Do

Deliverable: Content Scope & Granularity Model

03

V1 Release Scope & Roadmap Prioritization

- Help Vector to prioritize the 14 proposed initiatives into a v1 release
- Model which features ship first
- Bound personalization depth by role, sector, region & modality
- Bound v1 to review capacity - a gating factor

Deliverable: Prioritized V1 (Package A) Release Plan

04

Quality & Human-in-the-Loop Workflow

- Help Vector to design quality workflow for how AI & human reviewers QA content at scale
- Define review roles by phase and quality thresholds
- Build in accreditation safeguards (the 25% rule)
- Model review budget & capacity - set by AI-output quality

Deliverable: HITL Workflow + QA Threshold Model

The Metadata Behind Know-Feel-Do

Locked before extraction runs. Anything not captured pre-migration is lost or expensive to recover.

THE FIELD LAYERS

01**Instructional**

Outcomes, objectives, assessable and gating flags.

02**Provenance**

Source ID, last update, regulation, SME of record.

03**Compliance**

Accrediting body, expiry, jurisdiction, seat time.

04**Delivery**

Sector, subsector, role, modalities, language set.

05**Commercial**

Level, SKU, usage, customization permissions.

WHAT MAKES IT USABLE

- An owner and a source system named against every single field.
- A split between what AI infers and what a human must supply.
- Assessable and gating flags - these make test-out possible at all.
- Provenance is what keeps the content defensible years later.
- Delivery fields drive assembly. Wrong here and personalization breaks.
- Fields live across many systems today. Consolidation is the work.
- Locked recommendation targeted for the end of August.

Key takeaway: Metadata not captured before migration is either lost or expensive to reconstruct.

Resourcing the Prototype

The prototype needs named people, not roles. This is the input to the resourcing decision we take next week.

WHO WE NEED, AND FOR WHAT

01**Software Development**

Extend the engine and shell; own environments and access.

02**K&A Review Team**

Score composed output against the rubric; close the verdict.

03**Subject Matter Experts**

Sign off gap-fill on the selected courses, time-boxed.

04**Learning Experience Design**

Judge quality, log hours, own the side-by-side comparison.

05**UX and Product**

Own the admin path in Studio, from scope lock onward.

QUESTIONS FOR THIS SESSION

- What is the named ask per team, in people and in weeks?
- Is K&A capacity actually available in Q4, or already committed?
- Which SMEs, and who secures their time?
- Do we need a dedicated program manager for the prototype?
- Who is accountable for the prototype end to end?
- What does the October Scenario Simulator release take from us?
- What can start before scope lock without wasting effort?

Key takeaway: Capacity named in August is a plan. Capacity named in October is a delay.

Constraints, and What We Decide

The constraints we cannot engineer around, and the decisions that turn this session into a draft v1 scope.

WHAT COULD COST US THE DATE

01**K&A Review Capacity**

The gate that runs in months, and the team is already tight.

02**The Admin Path in Studio**

Product ownership and admin UX are both unresolved today.

03**Scenario Simulator Overlap**

Ships in October and competes for the same developers.

04**SME Availability**

Not schedulable at short notice, and gap-fill depends on it.

05**No Dedicated Program Manager**

Iterative work without a named owner drifts quietly.

DECISIONS TO LAND MONDAY

- Final course shortlist, one to two per bundle.
- Prototype goal statement and scorecard, in writing.
- Which workflow steps get built, and which stay manual.
- Named resourcing ask per team, in people and weeks.
- Owner for admin configuration in Learning Studio.
- What is explicitly out of the prototype and deferred to V1.
- An owner and a date against every item above.

Key takeaway: A draft v1 scope early next week depends on seven decisions, not on more analysis.

Delivery Risks: Named and Controlled

Eight risks came out of program planning. Each has a control against it - the full risk review is in the appendix.

THE FOUR THAT MATTER MOST

01

People

Three LMS teams, K&A and DLE are all needed, and K&A is already tight. The ask is named per team at scope lock, not mid-build.

02

Scope

A prototype that excites people invites new features. A written goal holds it; exceptions escalate rather than slip in.

03

Review capacity

No course goes live until it clears review, and that queue runs in months, not days. We size the review effort before we commit to scope / launch date.

04

Design

UX has been brought in after decisions are made, so work arrives fully formed. UX sits in the room from scope lock, with intent shared weekly.

Key takeaway: Named in August, these are manageable. Discovered in March, they are not.

Delivery Risks the Team Named

Raised in the program planning session, with the control we put against each one.

RISK	WHY IT BITES	HOW WE HOLD IT
Cross-team resourcing	Three LMS teams, K&A and DLE all needed; K&A is already tight	Name the ask per team at scope lock, not mid-build
Review capacity load in K&A	Course review is a real gate, measured in months not days	Size Michael's review effort before the build date is set
Scope creep after lock	New features will be proposed once the prototype excites people	Written prototype goal; exceptions escalate, they do not slip in
Leadership setting dates	Absent a visible plan, timelines get dictated from above	Show the plan first at the mid-August executive session
Estimating in the AI era	Build accelerates, product and UX inputs do not; less predictability	Go / no-go decision points with float, not one fixed date
UX engaged too late	Work arrives fully formed and sometimes infeasible	UX in the room from scope lock; weekly intent shared upfront
Learning Studio is the surface	Admin-level configuration is a market expectation and the UX is far from perfect today	Validate the admin build path with the product owner before scope lock
Program management depth	No dedicated PM; the project lead is new to learning and the work is iterative by nature	LearnSimple coaching in and out of the room across the next five weeks

Key takeaway: Every one of these is manageable if it is named in August rather than discovered in March.

Scenario Simulator + Knowledge Layer

The second initiative is not a parallel track. It is the behavioral assessment instrument the Knowledge Layer needs.

HOW THE TWO CONNECT

- 01 The missing measure**
Know and Feel are authored. Do has to be performed.
- 02 Mastery demonstration**
Evidence a learner has met a behavioral objective.
- 03 It decides who tests out of what**
Quiz scores can path knowledge. Scenario Simulator can path skill.
- 04 The conversation cannot run long**
Each phase caps its turns, so seat time stays predictable.
- 05 Locked final takeaway**
Every learner ends on the same instructional screen.

WHAT WE GAIN, WHAT WE OWE

- AlcoholEdu ships in October, before V1 locks.
- Best-received idea in twenty customer interviews.
- No admin can audit every learner conversation.
- The rubric and the final screen carry the proof.
- Learners can refuse AI. A disclaimer covers V1.
- Someone must own disclosures before October.
- You cannot test out of a skill. You can only show it.

Key takeaway: Know and Feel can be authored. Do has to be demonstrated.
